Treatment 36

Treatment 41

The patient, a 58-year-old male with diabetes, was presented to HyOx for hyperbaric treatment for chronic osteomyelitis of the right heel. The patient participated in 44 hyperbaric treatments while he was at LTAC. End Result: The patient did well and his leg was salvaged. He was released from the acute care hospital and was not complaining of pain from the buttocks region where he was beginning to get a sacral decubiti. He stopped his treatments as his wound was beginning to heal and granulation tissue appeared.
