Figure 6: Final Follow-Up

This 50-year-old insulin dependent female was referred to HyOx Medical Treatment Center with an ischemic left dorsal foot flap resulting from a degloving accident on an icy step by an ER surgeon after wound closure. The patient underwent debridement by a surgeon throughout the course of hyperbaric oxygen therapy and used a walker along with a left air-cast boot. The patient completed a total of 30 hyperbaric oxygen treatments.

**Result:** Flap salvaged with no skin graft or further surgical intervention needed. Patient regained full sensation and functional independence.
